Stellantis — AI / Machine Learning Infrastructure Team

Application: Machine Learning Infrastructure Engineer

Dear Hiring Team,

I am applying for the Machine Learning Infrastructure Engineer position within Stellantis' AI team. The opportunity to optimize deep-learning models for deployment on ECU targets — making the most of constrained resources for AI services and autonomous driving — sits exactly at the intersection of deep learning, optimization and infrastructure that I am most passionate about.

I hold a Master of Science in Distributed Systems & AI, built on a strong applied-mathematics foundation, and I have hands-on experience running deep-learning training and validation and setting up the tooling around ML workflows. In my most recent role I deployed deep-learning models in production and focused on efficient inference — reducing latency by 35% and sustaining 500+ concurrent requests — using ONNX export, CUDA acceleration, GPU-backed serving, Docker and CI/CD, with monitoring via Prometheus and Grafana. I am proficient in Python and the main deep-learning frameworks (PyTorch, TensorFlow), and I am comfortable benchmarking and validating models rigorously.

I want to be transparent about where I am growing: my strongest production experience is in Python-based DL and MLOps, and while I have the mathematical and systems foundations for model optimization (quantization, pruning) and for C++ and embedded targets, this is an area I am actively deepening. I learn new tools and low-level concepts quickly, and the chance to apply that to embedded inference on real automotive targets, alongside experienced teams, is precisely why this role excites me.

I communicate effectively in English and enjoy the high level of cross-team interaction this position involves. I would welcome the opportunity to discuss how my deep-learning and infrastructure background can contribute to your team, and how quickly I can ramp up on the embedded-optimization side.

Thank you for considering my application.

Kind regards,

Ossama Elhakki
